

A Practical Grammar of the Latin Language For the Use of Schools, Colleges, and Private Learners

Filesize: 6.01 MB

Reviews

*Comprehensive guideline for ebook fans. I have read and i am certain that i am going to going to go through yet again yet again down the road. You wont truly feel monotony at whenever you want of your own time (that's what catalogs are for concerning when you check with me).
(Keegan Abernathy)*

A PRACTICAL GRAMMAR OF THE LATIN LANGUAGE FOR THE USE OF SCHOOLS, COLLEGES, AND PRIVATE LEARNERS

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 82 pages. Original publisher: Washington, DC : U. S. Nuclear Regulatory Commission, Office of Nuclear Regulatory Research, 2009 OCLC Number: (OCoLC)631245867 Subject: Spent reactor fuels -- United States. Excerpt: . . . from design codes, produce burnup values that are generally within approximately 2 of the burnup values predicted by design codes, whereas the out-of-core measurement systems produce average assembly burnup results that are within the expected fork detector accuracy range of 2. 2 - 5 of true burnup. However, there were some fork detector examinations with maximum assembly deviations as high as 9. 1 . Regardless, these examination programs demonstrated that out-of-core measurements could identify substantially underburned fuel assemblies and hence could be used to prevent them from being accidentally loaded into spent fuel transport casks. Careful calibration against an assembly of known burnup, known cooling time, and identical geometry is required to achieve the reported accuracies with the fork detector used in the U. S. studies. Thus, in practice, these out-of-core measurements are dependent on and calibrated against reactor burnup records. Consequently, the burnup values inferred from these measurements tend to have a higher uncertainty than reactor record assembly burnup values determined using in-core measurements. Fuel assembly axial-burnup profiles have a significant impact on reactivity and are therefore an important component in determining average assembly burnup. For the fork detector examination programs evaluated in this report, personnel used measurements at the assembly centerline (midplane) and assumed that the axial profile of the reference assembly could be used to estimate the assembly average burnup (i. e. , it was assumed that the axial profiles were the same for the reference and measured assemblies). This approach could give erroneous burnup measurement results for assemblies...
